

21. This drawing shows the continual process of change that reshaped the north-east section of the Inner Harbour over the better part of a century. The limits of development shifted steadily southward from the Windmill Line to the Harbourhead Line, and the shoreline soon followed in that general direction. The breakwater that once bordered the mouth of the Don River (shown by a series of narrow lines on the plan; see also ill. 3) has been buried by fill, its function replaced by the Keating Channel to the south. The site of the National Iron Works also experienced steady change, edging west from the shoreline of 1847 (shown by the dotted lines) to its temporary limits in 1930. Dredging will expand the property to the former boundary of the marsh lands (marked by the heavy line that would soon become a dock wall) by the end of the decade.
